# TABLE OF CONTENTS

## Section-A (Linked List)

S. No.	Practical Description	Page Nos.	COs
1	Implementation of Linked List using array.	1-5	CO-1
2	Implementation of Linked List using Pointers.	6-9	CO-1
3	Implementation of Doubly Linked List using Pointers.	10-16	CO-1
4	Implementation of Circular Single Linked List using Pointers.	17-19	CO-1
5	Implementation of Circular Doubly Linked List using Pointers.	20-25	CO-1

## Section-B (Stack)

S. No.	Practical Description	Page Nos.	COs
1	Implementation of Stack using Array.	26-28	CO-2
2	Implementation of Stack using Pointers.	29-32	CO-2
3	Program for Tower of Hanoi using recursion.	33	CO-2
4	Program to find out factorial of given number using recursion .Also show the various states of stack using in this program.	34-35	CO-2

## Section-C (Queue)

S. No.	Practical Description	Page Nos.	COs
1	Implementation of Queue using Array.	36-37	CO-2
2	Implementation of Queue using Pointers.	38-40	CO-2
3	Implementation of Circular Queue using Array.	41-43	CO-2

## Section-D (Trees)

S. No.	Practical Description	Page Nos.	COs
1	Implementation of Binary Search Tree.	44-48	CO-3
2	Conversion of BST PreOrder/PostOrder/InOrder.	49-54	CO-3
3	Implementation of Kruskal Algorithm	55-57	CO-4
4	Implementation of prime Algorithm	58-59	CO-4
5	Implementation of Dijkstra Algorithm	60-63	CO-4

## Section-E (Sorting & Searching)

S. No.	Practical Description	Page Nos.	COs
1	Implementation of Sorting a. Bubble b. Selection c. Insertion d. Quick e. Merge	64-73	CO-5
2	Implementation of Binary Search on a list of numbers stored in an Array	74-76	CO-5
3	Implementation of Binary Search on a list of strings stored in an Array	77-79	CO-5
4	Implementation of Linear Search on a list of strings stored in an Array	80-81	CO-5

# Section-A (Linked List)

## Practical No.: 1

Program Description: Implementation of Linked List using array.

Solution:

```
#include<stdio.h>

### Practical No.: 3

Program Description: Program for Tower of Hanoi using recursion.

Solution:

```
#include<stdio.h>
int step=0;
// C recursive function to solve tower of hanoi puzzle
void towerOfHanoi(int n, char from_rod, char to_rod, char aux_rod)
{
    step++;
    if (n == 1)
    {
        printf("\nStep-%d: Move disk 1 from rod %c to rod %c", step,from_rod, to_rod);
        return;
    }
    towerOfHanoi(n-1, from_rod, aux_rod, to_rod);
    printf("\nStep-%d: Move disk %d from rod %c to rod %c", step,n, from_rod, to_rod);
    towerOfHanoi(n-1, aux_rod, to_rod, from_rod);
}

int main()
{
    int n; // Number of disks
    printf("Enter the number of disks : ");
    scanf("%d",&n);
    towerOfHanoi(n, 'A', 'C', 'B'); // A, B and C are names of rods
    return 0;
}
```

Output:

#### Practical No.: 4

Program Description: Program to find out factorial of given number using recursion .Also show the various states of stack using in this program.

Solution:

```
#include <iostream>

using namespace std;

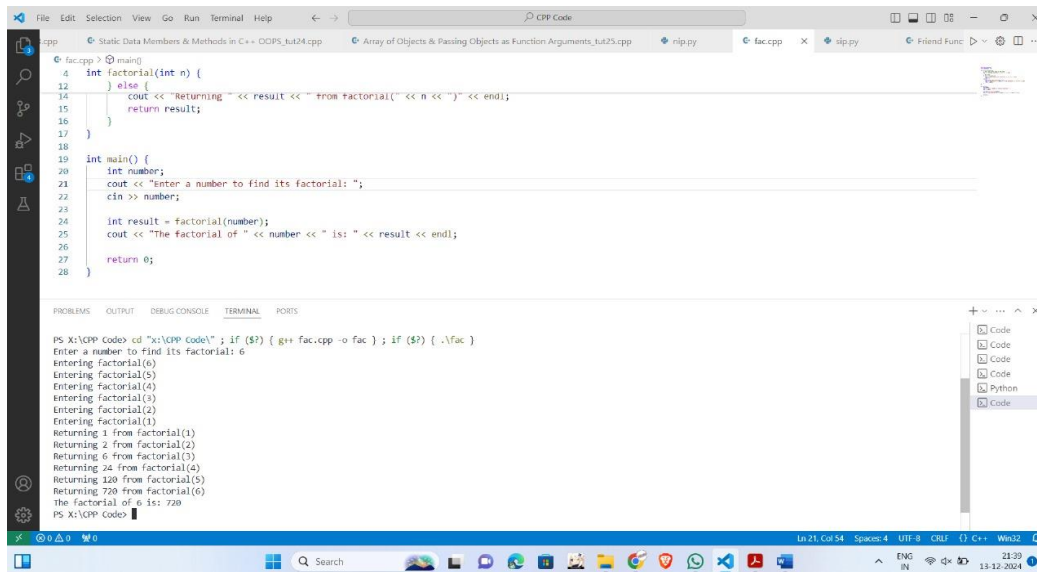

int factorial(int n) {
    // Print the current state of the stack
    cout << "Entering factorial(" << n << ")" << endl;
    // Base case
    if (n == 0 || n == 1) {
        cout << "Returning 1 from factorial(" << n << ")" << endl;
        return 1;
    } else {
        int result = n * factorial(n - 1);
        cout << "Returning " << result << " from factorial(" << n << ")" << endl;
        return result;
    }
}

int main() {
    int number;
    cout << "Enter a number to find its factorial: ";
    cin >> number;

    int result = factorial(number);
    cout << "The factorial of " << number << " is: " << result << endl;

    return 0;
}
```

OUTPUT:

The screenshot shows a C++ IDE with a file named `fac.cpp` open. The code defines a recursive `factorial` function and a `main` function that prompts the user for a number and prints its factorial. The output window shows the program's execution, including recursive calls and returns, leading to the final result of 720 for the input 6.

```
4 int factorial(int n) {
12 } else {
14     cout << "Returning " << result << " from factorial(" << n << ") " << endl;
15     return result;
16 }
17 }
18
19 int main() {
20     int number;
21     cout << "Enter a number to find its factorial: ";
22     cin >> number;
23
24     int result = factorial(number);
25     cout << "The factorial of " << number << " is: " << result << endl;
26
27     return 0;
28 }
```

Output:

The screenshot shows the Visual Studio Code editor with a project named "Project Final". The interface includes a sidebar with icons for Explorer, Search, Source Control, Run and Debug, and Extensions. The main editor area displays a C++ program with a menu for binary tree operations. The menu options are: 1. Insert Node, 2. Delete Node, 3. Pre Order Traversal, 4. Post Order Traversal, 5. In Order Traversal, 6. All Traversal, 7. Search an Element, 8. Find Minimum Element, 9. Find Maximum Element, and 0. Exit. The program prompts the user to "Enter Your Choice (0-9) :". The terminal output shows the command prompt "PS D:\Project Final>". The status bar at the bottom indicates the current line and column as "Ln 35, Col 2", the encoding as "UTF-8", the line ending as "CRLF", and the language as "C++". The taskbar at the bottom shows the Windows search bar, task view, and several open applications including Edge, File Explorer, Mail, Chrome, Firefox, VS Code, and WhatsApp. The system tray shows the temperature as "23°C", the time as "12:43 PM", and the date as "27-12-2022".

        return 0;
    }

```

**OUTPUT:**

The screenshot shows a C++ IDE with the following code in the editor:

```

1 #include <iostream>
2 #include <vector>
3 #include <algorithm>
4
5 using namespace std;
6
7 // Structure to represent an edge
8 struct Edge {
9     int src, dest, weight;
10 };
11
12 // Structure to represent a subset for Union-Find
13 struct Subset {
14     int parent;
15     int rank;
16 };
17
18 // Function to compare two edges (used for sorting)
19 bool compareEdges(const Edge &a, const Edge &b) {
20     return a.weight < b.weight;
21 }
22
23 // Function to find the parent of a node
24 int findParent(Subset subsets[], int i) {
25     if (subsets[i].parent == i)
26         return i;
27     return findParent(subsets, subsets[i].parent);
28 }
29
30 // Function to perform Union operation
31 void Union(Subset subsets[], int x, int y) {
32     int xparent = findParent(subsets, x);
33     int yparent = findParent(subsets, y);
34     if (xparent != yparent)
35         subsets[xparent].parent = yparent;
36 }
37
38 // Function to print the Minimum Spanning Tree
39 void printMST(vector<Edge> edges, int V) {
40     sort(edges.begin(), edges.end(), compareEdges);
41     Subset subsets[V];
42     for (int i = 0; i < V; i++)
43         subsets[i].parent = i;
44     for (int i = 0; i < edges.size(); i++) {
45         Edge e = edges[i];
46         int xparent = findParent(subsets, e.src);
47         int yparent = findParent(subsets, e.dest);
48         if (xparent != yparent) {
49             Union(subsets, e.src, e.dest);
50             cout << e.src << " -- " << e.dest << " == " << e.weight << endl;
51         }
52     }
53 }
54
55 int main() {
56     int V = 4;
57     vector<Edge> edges = {
58         {0, 1, 10},
59         {0, 2, 6},
60         {0, 3, 5},

## Section-E (Sorting & Searching)

### Practical No.: 1

Program Description: Implementation of sorting.

**(A).Bubble**

**(B).Selection**

**(C).Insertion**

**(D).Quick**

**(E).Merge**

**Solution:**

**(A).Bubble**

```
#include <bits/stdc++.h>

using namespace std;

void bubbleSort(vector<int>& arr) {

    int n = arr.size();

    bool swapped;

    for (int i = 0; i < n - 1; i++) {

        swapped = false;

        for (int j = 0; j < n - i - 1; j++) {

            if (arr[j] > arr[j + 1]) {

                swap(arr[j], arr[j + 1]);

                swapped = true;

            }

        }

        if (!swapped)

            break;

    }

}

void printVector(const vector<int>& arr) {

    for (int num : arr)
```

```

        cout << " " << num;
    }

int main() {

    vector<int> arr = { 64, 34, 25, 12, 22, 11, 90 };

    bubbleSort(arr);

    cout << "Sorted array: \n";

    printVector(arr);

    return 0;

}

```

OUTPUT:

The screenshot shows a C++ IDE with the following code in the editor:

```

25 void printVector(const vector<int>& arr) {
26     cout << " " << num;
27 }
28
29
30 int main() {
31     vector<int> arr = { 64, 34, 25, 12, 22, 11, 90 };
32     bubbleSort(arr);
33     cout << "Sorted array: \n";
34     printVector(arr);
35     return 0;
36 }

```

The terminal output shows the execution of the program:

```

PS X:\CPP Code> cd "X:\CPP Code\" ; if ($?) { g++ fac.cpp -o fac }; if ($?) { .\fac }
Sorted array:
11 12 22 25 34 64 90
PS X:\CPP Code>

```

### (B). Selection

```
#include <bits/stdc++.h>

using namespace std;

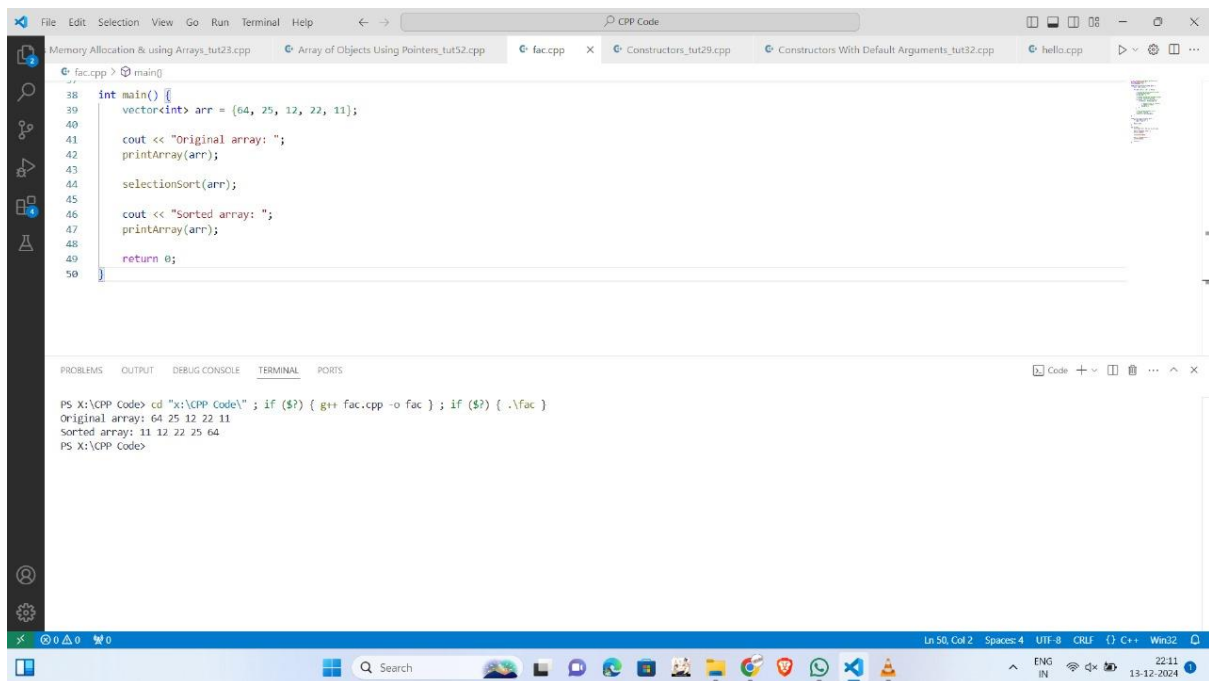

void selectionSort(vector<int> &arr) {
    int n = arr.size();
    for (int i = 0; i < n - 1; ++i) {
        int min_idx = i;
        for (int j = i + 1; j < n; ++j) {
            if (arr[j] < arr[min_idx]) {

                // Update min_idx if a smaller
                // element is found
                min_idx = j;    }
        }
        swap(arr[i], arr[min_idx]); }
}

void printArray(vector<int> &arr) {
    for (int &val : arr) {
        cout << val << " ";
    }
    cout << endl;
}

int main() {
    vector<int> arr = {64, 25, 12, 22, 11};
    cout << "Original array: ";
    printArray(arr);
    selectionSort(arr);
    cout << "Sorted array: ";
    printArray(arr);
    return 0; }
```

## Output:

The screenshot shows a Visual Studio Code editor window with a C++ file named `fac.cpp`. The code defines a `main` function that creates a `vector<int>` `arr` with the values `{64, 25, 12, 22, 11}`. It then prints the original array, sorts it using `selectionSort(arr)`, and prints the sorted array. The terminal output shows the execution of the program, displaying the original array `64 25 12 22 11` and the sorted array `11 12 22 25 64`.

```
int main() {  
    vector<int> arr = {64, 25, 12, 22, 11};  
    cout << "Original array: ";  
    printArray(arr);  
    selectionSort(arr);  
    cout << "Sorted array: ";  
    printArray(arr);  
    return 0;  
}
```

```
PS X:\CPP Code> cd "X:\CPP Code\"; if ($?) { g++ fac.cpp -o fac }; if ($?) { .\fac }  
Original array: 64 25 12 22 11  
Sorted array: 11 12 22 25 64  
PS X:\CPP Code>
```

### (C). Insertion

```
#include <iostream>

using namespace std;

void insertionSort(int arr[], int n)
{
    for (int i = 1; i < n; ++i) {
        int key = arr[i];
        int j = i - 1;
        while (j >= 0 && arr[j] > key) {
            arr[j + 1] = arr[j];
            j = j - 1;
        }
        arr[j + 1] = key;
    }
}

void printArray(int arr[], int n)
{
    for (int i = 0; i < n; ++i)
        cout << arr[i] << " ";
    cout << endl;
}

int main()
{
    int arr[] = { 12, 11, 13, 5, 6 };
    int n = sizeof(arr) / sizeof(arr[0]);
    insertionSort(arr, n);
    printArray(arr, n);
    return 0;
}
```

**(D).Quick**

```
#include <bits/stdc++.h>

using namespace std;

int partition(vector<int>& arr, int low, int high) {
    int pivot = arr[high];

    int i = low - 1;
    for (int j = low; j <= high - 1; j++) {
        if (arr[j] < pivot) {
            i++;
            swap(arr[i], arr[j]);
        }
    }
    swap(arr[i + 1], arr[high]);
    return i + 1;
}

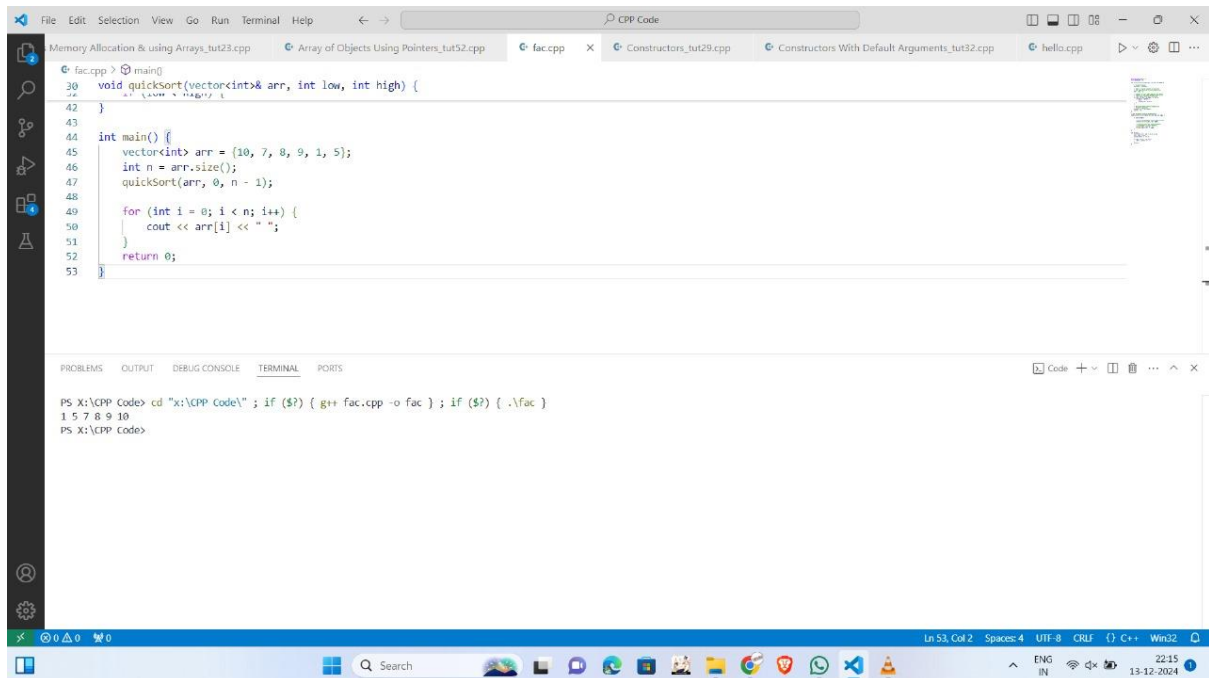

void quickSort(vector<int>& arr, int low, int high) {
    if (low < high) {
        int pi = partition(arr, low, high);
        quickSort(arr, low, pi - 1);
        quickSort(arr, pi + 1, high);
    }
}

int main() {
    vector<int> arr = {10, 7, 8, 9, 1, 5};
    int n = arr.size();
    quickSort(arr, 0, n - 1);

    for (int i = 0; i < n; i++) {
        cout << arr[i] << " ";
    }
    return 0;
}
```

OUTPUT:

The screenshot shows a Visual Studio Code editor window with a C++ file named `fac.cpp`. The code implements a quicksort algorithm on a vector of integers. The `main` function initializes a vector `arr` with the values `{10, 7, 8, 9, 1, 5}`, calls `quicksort(arr, 0, n - 1)`, and then prints the sorted array elements. The terminal at the bottom shows the command `g++ fac.cpp -o fac` being executed, followed by the output of the program: `1 5 7 8 9 10`.

```
1 // fac.cpp
2 #include <iostream>
3 #include <vector>
4 #include <algorithm>
5
6 void quicksort(vector<int>& arr, int low, int high) {
7     if (low < high) {
8         int pivot = arr[high];
9         int i = low - 1;
10        for (int j = low; j < high; j++) {
11            if (arr[j] < pivot) {
12                i++;
13                swap(arr[j], arr[i]);
14            }
15        }
16        swap(arr[i], arr[high]);
17        quicksort(arr, low, i);
18        quicksort(arr, i + 1, high);
19    }
20 }
21
22 int main() {
23     vector<int> arr = {10, 7, 8, 9, 1, 5};
24     int n = arr.size();
25     quicksort(arr, 0, n - 1);
26     for (int i = 0; i < n; i++) {
27         cout << arr[i] << " ";
28     }
29     return 0;
30 }
```

PS X:\CPP Code> cd "X:\CPP Code\" ; if (\$?) { g++ fac.cpp -o fac }; if (\$?) { .\fac }

1 5 7 8 9 10

PS X:\CPP Code>

### (E).Merge

```
#include <bits/stdc++.h>

using namespace std;

void merge(vector<int>& arr, int left,
           int mid, int right) {
    int n1 = mid - left + 1;
    int n2 = right - mid;
